Eingabezeile

Breakpoints: (gdb) break <location>

Breakpoints

Unterbrechen der Ausführung, sobald eine bestimmte **Codestelle** erreicht wird.

- Funktionsname
- absolute/relative Codezeile
- *Adresse

} optionaler Prefix: Quelldatei

Unterbricht vor dem Ausführen von...

`(gdb) b main`	Funktion `main`
`(gdb) b main.cc:main`	... aus main.cc
`(gdb) b 63`	Zeile 63 in aktueller Datei
`(gdb) b main.cc:63`	Zeile 63 in main.cc
`(gdb) b +3`	In 3 Zeilen
`(gdb) b *0x100a9ca`	An Adresse 0x100a9ca

Temporäre & Bedingte Breakpoints

Temporäre Breakpoints: `(gdb) tbreak <location>`

Werden nach dem 1. Auslösen entfernt, sonst wie „normale“ Breakpoints.

Temporäre & Bedingte Breakpoints

Temporäre Breakpoints: `(gdb) tbreak <location>`

Werden nach dem 1. Auslösen entfernt, sonst wie „normale“ Breakpoints.

Bedingte Breakpoints: `(gdb) break <location> if <cond>`

Unterbrechung nur falls Bedingung erfüllt ist, z.B:

```
(gdb) break interrupt_handler if vector == 33
```

Unterbricht nur, falls die Funktion interrupt_handler aufgrund von Tastatureingabe (Vektor 33) betreten wurde.

Temporäre & Bedingte Breakpoints

Temporäre Breakpoints: `(gdb) tbreak <location>`

Werden nach dem 1. Auslösen entfernt, sonst wie „normale“ Breakpoints.

Bedingte Breakpoints: `(gdb) break <location> if <cond>`

Unterbrechung nur falls Bedingung erfüllt ist, z.B:

```
(gdb) break interrupt_handler if vector == 33
```

Unterbricht nur, falls die Funktion interrupt_handler aufgrund von Tastatureingabe (Vektor 33) betreten wurde.

Achtung: Nichttriviale Break- oder Watchpoints werden ohne Hardwareunterstützung umgesetzt → Langsam!

Watchpoints (Data Breakpoints)

Unterbricht wenn Speicherbereich geschrieben (oder gelesen) wird:

watch <location>	Schreibzugriff
rwatch <location>	Lesezugriff
awatch <location>	Schreib- oder Lesezugriff

```
(gdb) watch guard
(gdb) watch guard if guard.locked == 1
```

Verwalten von Break-/Watchpoints

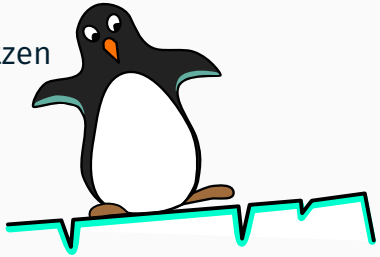
ignore	<id> <N>	Breakpoint N mal ignorieren
enable	<id> <id> ..	Breakpoints aktivieren
disable	<id> <id> ..	Breakpoints deaktivieren
delete	<id> <id> ..	Breakpoints löschen

Schrittweise Ausführung

step *[count]* – Nächste Zeile
step**i** *[count]* – Nächste Instruktion
next *[count]* – Nächste Zeile (ohne Funktionen zu betreten)
next**i** *[count]* – Nächste Instruktion (ohne Funktionen zu betreten)
until *[count]* – Wiederhole **n**ext bis zur **textuell** nächsten Zeile

Optional: Anzahl Wiederholungen

finish – Bis zum return des aktuellen Stackframes
advance <location> – Bis zu <location>
continue – Ausführung (bis zum Haltepunkt) fortsetzen



Der skip Befehl

```
unsigned int numCPUs = System::getNumberOfCPUs();
kout << "numCPUs: " << numCPUs << endl;
ApplicationProcessor::boot();
```

Der skip Befehl

```
unsigned int numCPUs = System::getNumberOfCPUs();
kout << "numCPUs: " << numCPUs << endl;
ApplicationProcessor::boot();
```

Übergehe aktuelle Funktion:

```
(gdb) skip
```

Übergehe eine einzelne Funktion:

```
(gdb) skip function OutputStream::operator<<
```

Übergehe alle Funktionen aus einer Datei:

```
(gdb) skip file object/outputstream.cc
```

Der `info` Befehl

info **a**rgs	Auflistung der Aufrufargumente
info **lo**cals	Auflistung aller lokalen Variablen
info **r**egisters	Auflistung der Registerwerte
info **b**reakpoints	Auflistung der Breakpoints
info **t**hreads	Auflistung der Threads/CPUs
info **sk**ip	Auflistung der zu überspringenden Funktionen
...	siehe `(gdb) help info`

Ergänzend:

back**t**race	Auflistung geschachtelter Stackframes
frame <id>	Wechsel zu Stackframe
thread <id>	Wechsel zu Thread/CPU

Ausgabe von Werten in Speicher / Register

```
(gdb) print/<Format> <Ausdruck>
(gdb) examine/<Anzahl><Format><Einheit> <Ausdruck>
```

Werte für <Format>

x	Ganzzahl (hex)
d	Ganzzahl (mit VZ, dezimal)
u	Ganzzahl (ohne VZ, dezimal)
t	Ganzzahl (binär) (**t**wo)
a	Adresse (hex) + Offset zum Startsymbol
f	Float
i	Instruktion

Werte für <Einheit>

b	Byte	8-bit
h	Halfword	16-bit
w	Word	32-bit
g	Giant word	64-bit

Bestimmen des Typs eines Symbols

```
ptype <Symbol>
```

Verändern des Zielsystems: (gdb) set

Verändern eines Registers

```
(gdb) set $esp = 0xdeadbeef
```

Verändern einer Variable / Speicherbereichs

```
(gdb) set numCPUs = 2
(gdb) set *((int *) 0x1013fdc) = 42
```

GDB vs. Optimierungen

Generell: Optimierungen sind doof fürs Debuggen:

- Inlining von Funktionen
- Elimination von Variablen
- ...

Relevante Compileroptionen

-g	Generiere Debuginformationen
-Oo	Optimierungen aus
-Og	Nur Optimierungen, die das Debuggen nicht stören

GDB vs. Optimierungen

Generell: Optimierungen sind doof fürs Debuggen:

- Inlining von Funktionen
- Elimination von Variablen
- ...

Relevante Compileroptionen

-g	Generiere Debuginformationen
-O0	Optimierungen aus
-Og	Nur Optimierungen, die das Debuggen nicht stören
-O2	Fast alle Optimierungen

Laden der `.gdbinit`

Automatische Ausführung von gdb-Befehlen in `.gdbinit`

- Vordefinierte Breakpoints
- Eigene Skripte

`~/.config/gdb/gdbinit` oder `~/.gdbinit`

auto-load local-gdbinit	Lade lokale `.gdbinit`-Datei
add-auto-load-safe-path ~/stubs	Schalte Pfad zum Laden frei
set disassembly-flavor intel	Nutzte Intel-, statt AT&T-Syntax
set print asm-demangle on	Löse Name Mangling auf

Beispielhafte projektlokale `.gdbinit`

```
b assertion_failed
b Core::die
```

GDB & GEF in BS

Die bittere Wahrheit...

Ihr werdet entkäfern müssen

GDB & GEF in BS

Die bittere Wahrheit...

Ihr werdet entkäfern müssen

- `make qemu-gdb-noopt`

→ Profit?

- `make qemu-gdb`
- `make VERBOSE= QEMUCPUS=1 all`
- `make qemu-wait` + `make gdb` oder externer Debugger

Vorgegebenes GEF

```
source tools/gdbinit-gef.py
```

Fragen?

https://sourceware.org/gdb/current/onlinedocs/gdb.pdf
https://www.qemu.org/docs/master/system/monitor.html

Anhang

Snippet: Ausgabe von Details zur Exception im Interrupt Handler

```
// Optional: Print exceptions on DBG stream to support debugging
if (vector <= Core::Interrupt::SECURITY_EXCEPTION) {
  DBG << "Exception␣" << dec << vector;
  switch (vector) {
    case 0:  DBG << "␣(Div␣by␣0)"; break;
    case 6:  DBG << "␣(Invalid␣Opcode)"; break;
    case 10: DBG << "␣(Invalid␣TSS)"; break;
    case 13: DBG << "␣(General␣Protection␣Fault)"; break;
    case 14: DBG << "␣(Page␣Fault)"; break;
    default: break;
  }
  if (context->error_code != 0) {
    DBG << "␣[" << bin << context->error_code << "]";
  }
  DBG << "␣@␣" << hex << context->ip << flush;
  DBG << endl;
}
```
